BALANCING EXERCISE-INDUCED INFLAMMATION

by Laurel M. Wentz, PhD, RD, CSSD

EXERCISE-INDUCED INFLAMMATION IS THE BODY’S RESPONSE TO INJURY DUE TO INTENSE PHYSICAL ACTIVITY

- The immune system response causes redness, swelling, pain.
- Acute inflammation is a normal response to high-intensity exercise, but prolonged (chronic) inflammation is a sustained response that affects the entire body.
- Prolonged Inflammation:
  1. Causes fatigue, muscle damage and soreness.
  2. Limits muscle growth and training progression and increases muscle loss.
  3. Modulating prolonged inflammation may enhance recovery & reduce soreness.

ROLE OF NUTRITION IN REDUCING INFLAMMATION:

CONSUME FLUIDS DURING EXERCISE
- Consume fluids and electrolytes to prevent dehydration and maintain saliva, which contains anti-microbial properties.

MEET PROTEIN REQUIREMENTS
- Supports immune cell synthesis & reduces exercise-induced muscle damage.
- Consume 20-30 grams of high-quality protein post-exercise (depending on body weight).

INCREASE OMEGA-3 FATTY ACIDS
- Essential fats which support brain health & reduce inflammation.
- Mickleborough et al showed Creatine Kinase (a marker of muscle damage) decreased with omega-3 marine oil compared to a placebo.
- High omega-3 foods: salmon, tuna, mackerel, herring, walnuts, flaxseed, chia seeds.
- Aim for 1-3 grams/day.

SELECT HIGH-ANTIOXIDANT FOODS
- Consuming fruits/veggies vs. excess antioxidant supplements (which have been shown to inhibit muscle recovery and impair training adaptations) will dampen the oxidative stress caused by exhaustive exercise.
- Foods high in vitamins C, E, and A: dark leafy greens, nuts/seeds, avocado, broccoli, peppers, berries, citrus, tomatoes, carrots, sweet potatoes/squash.

TRY TART CHERRY JUICE
- Shown to maintain muscle strength and reduce muscle pain by reducing inflammation and oxidative stress.
- High in anthocyanins — antioxidant found in purple and red produce.

OPTIMIZE VITAMIN D
- Made by the body in response to sunlight, and regulates inflammatory response.
- Many athletes are deficient due to low sun exposure during peak hours (10am-2pm), and the difficulty of getting enough through food.
- High vitamin D foods: fatty fish, egg yolks, fortified dairy products.
- Typical needs: 2000-5000 IU vitamin D per day, depending on diet and outdoor activity.

EXPERIMENT WITH NITRIC OXIDE & NITRATES
- Nitrates convert to nitric oxide (NO) in the body.
- Nitric oxide: Increases blood flow, which may reduce inflammation & enhance recovery.
- High nitrate foods: celery, leafy greens, beets.

SEASON WITH HERBS & SPICES
- Contain various antioxidants, minerals, vitamins.
- Best choices: ginger, turmeric (curry), garlic, cinnamon, rosemary.
